Memory Support

The X10SDV-TLN4F/F motherboard supports up to 128GB of DDR4 ECC RDIMM or 64GB of DDR4 ECC/Non-ECC UDIMM of speeds up to 2133MHz in four memory slots.

Note: Check the Supermicro website for recommended memory modules.

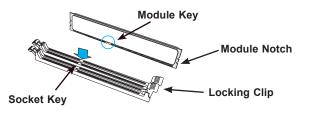

DIMM Memory Installation

When installing memory modules, the DIMM slots should be populated in the following order: DIMMA1. DIMMB1. then DIMMA2. DIMMB2.

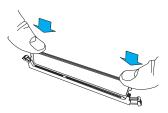

- Always use DDR4 DIMM modules of the same size, type and speed. Mixing memory modules of different types and speeds is not allowed.
- The motherboard will support one DIMM module installed. However, for best memory performance, install DIMM modules in pairs.

Installing DIMM Memory Modules

1. Align the key on the bottom of the DIMM module against the key on the memory slot. Take note of the notches on the side of the DIMM module, and of the locking clips on the socket to avoid causing damage.

2. Install the DIMM module straight down into the socket until it is securely seated in the socket. The side clips will automatically lock the module into

Note: Refer to Chapter 2 of the User Manual for detailed information on memory support and CPU/ motherboard installation instructions.
